

CATCHIS

CATCHIS

An environmental catchment
management information system

Summary

CatchIS team:

Cranfield: Steve Hallett, Jack Hannam, Ann Holden

ADAS: Chris Fawcett, Chris Procter

Generic substances entering and affecting water abstraction source

Regular diffuse application

- Pesticides
- Nitrates
- Phosphates

Regulatory environment
Cost of treatment
Price control
Who pays the bill?

Water Framework Directive

Nitrates Directive

Water Act

dwi

Regulation & legislation

CATCHIS

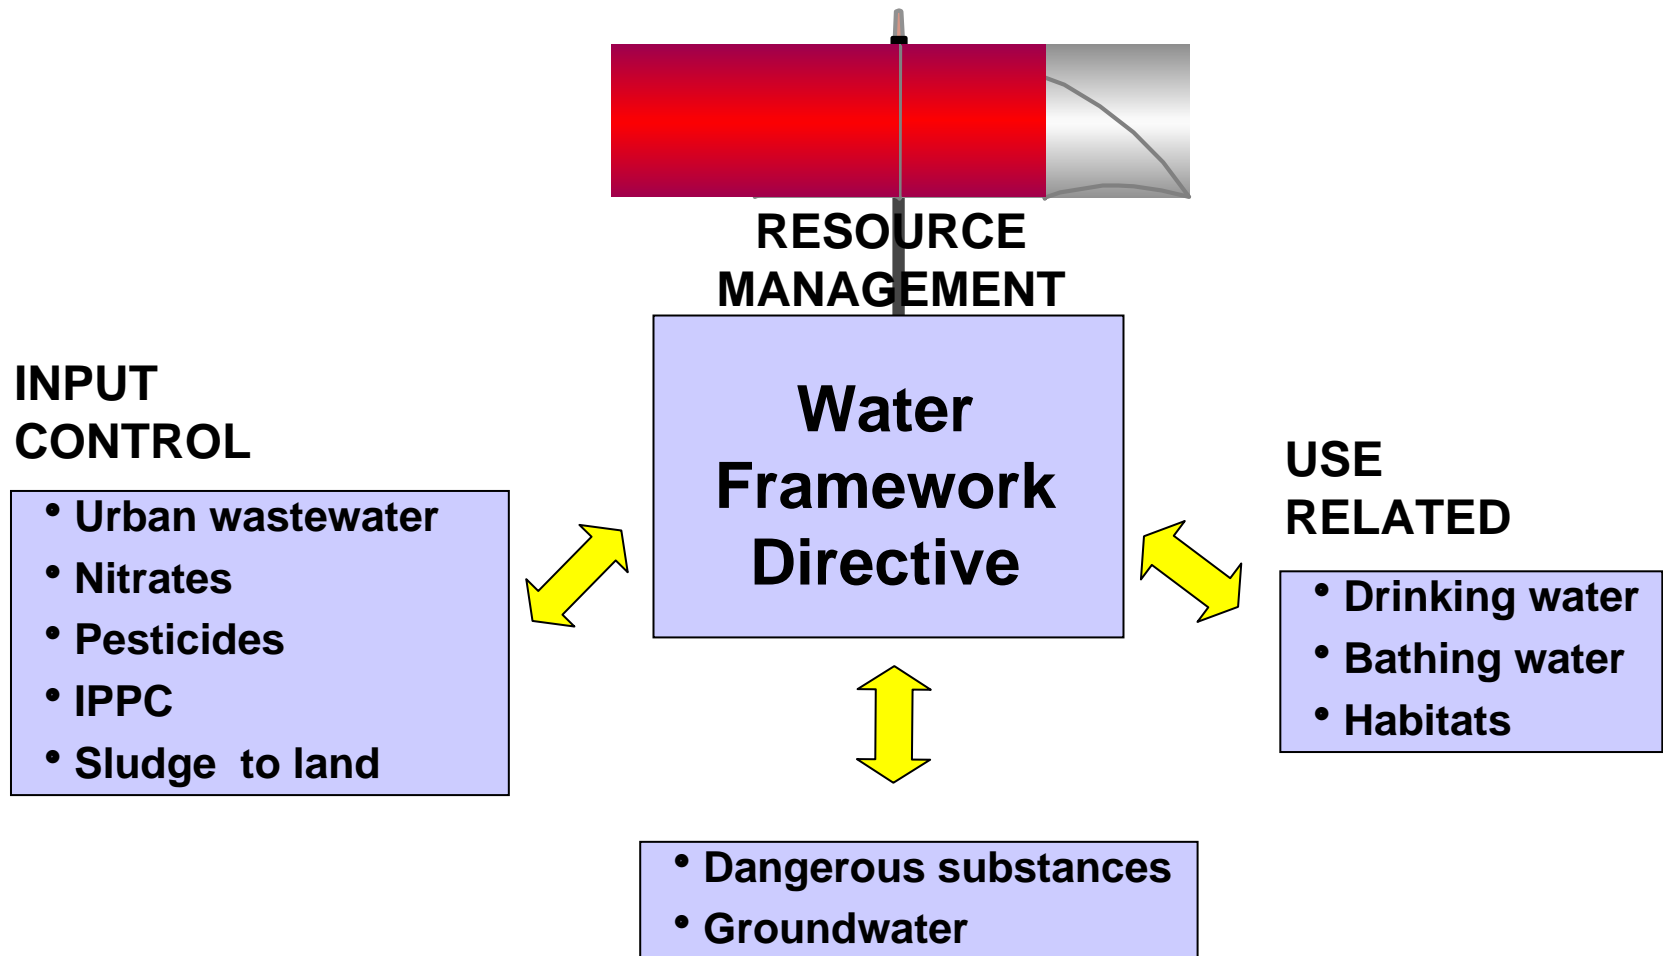

- “With dense populations and competing land uses, the interaction of land and water is extremely important and is increasingly recognised in law. The ability to manage these complex relationships at the river catchment level is key. **CatchIS** provides a set of powerful tools to address this.”

Severn Trent Water Ltd.

A tool underpinning Water Framework Directive
Follows ten years of development

CatchIS and the Water Framework Directive

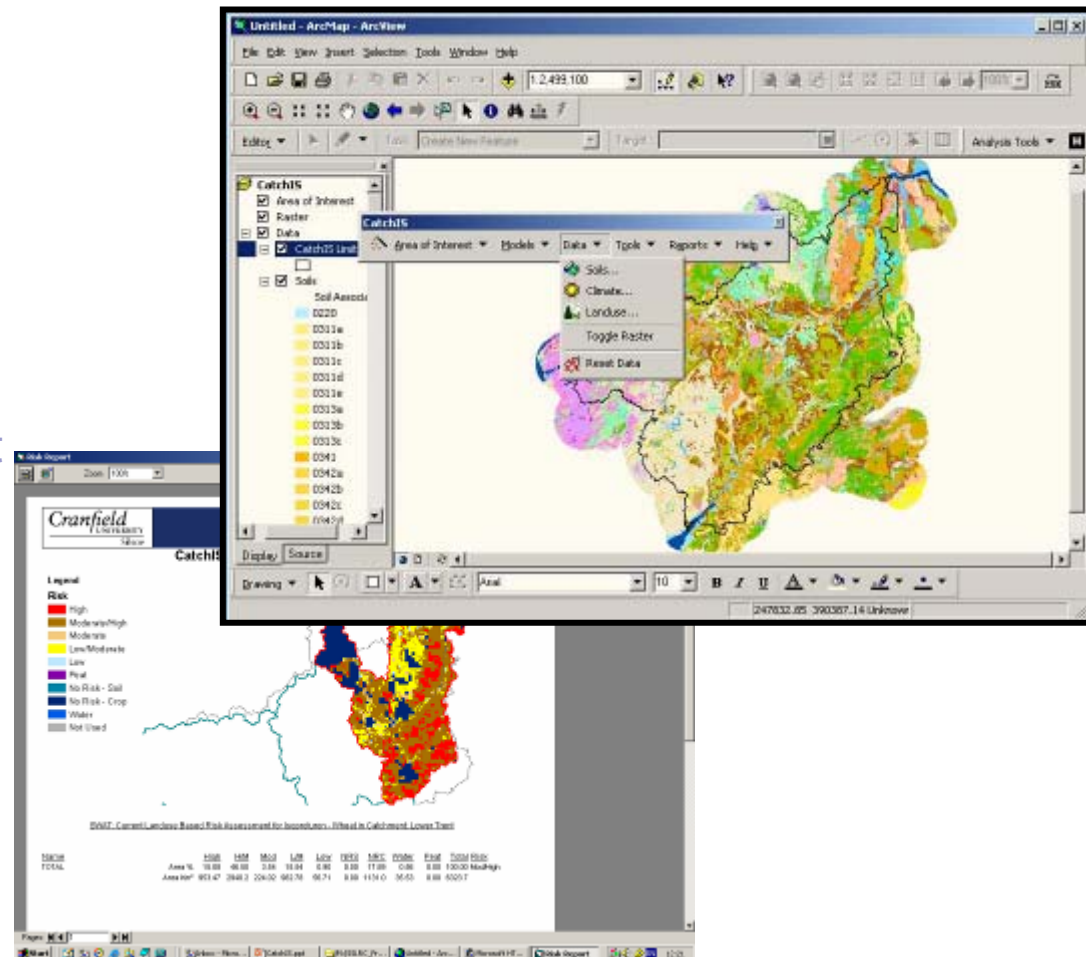

CatchIS Overview

Main Features:

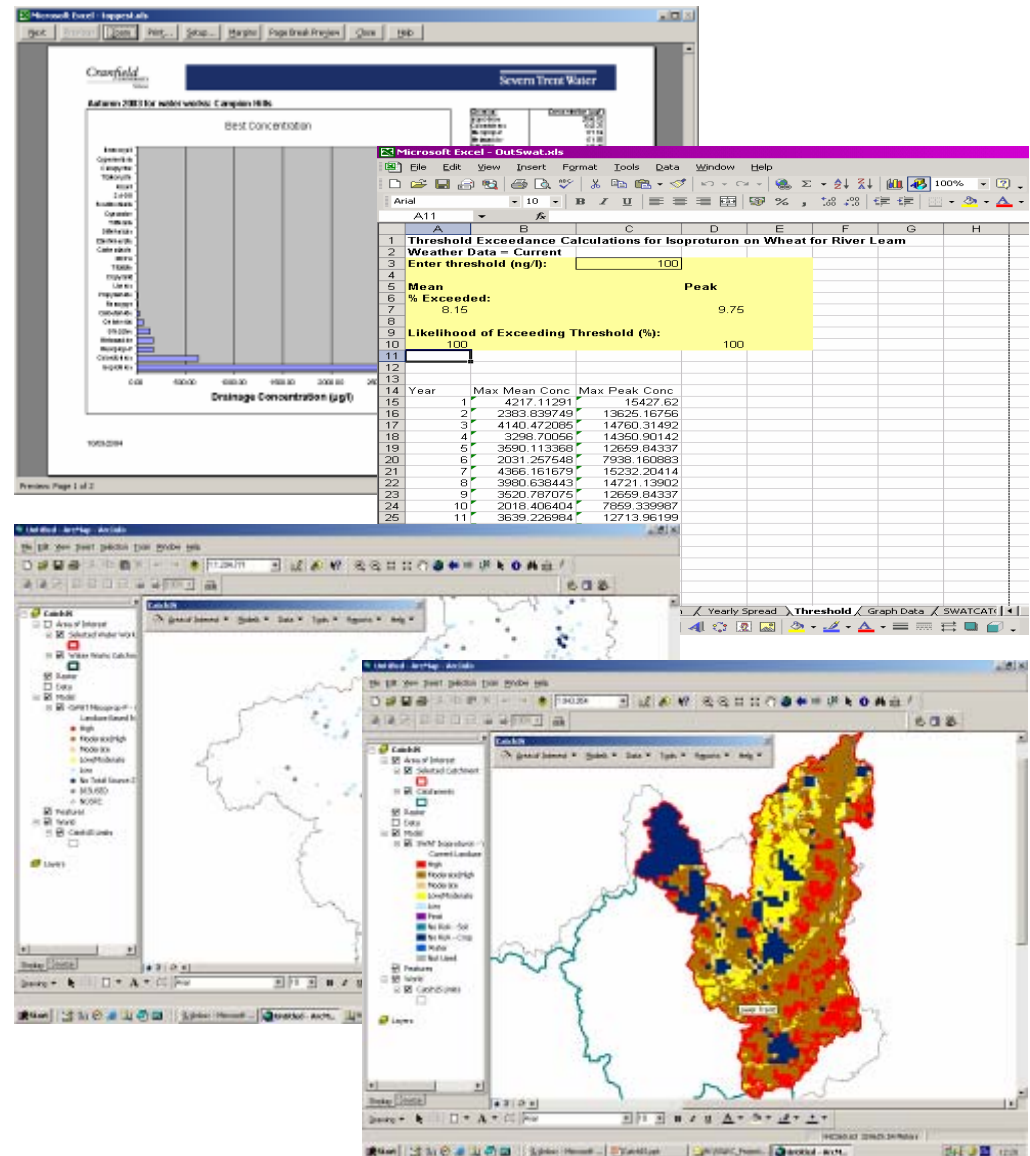

- Runs leading water quality risk assessment models
- Models operate on a range of areas of interest
- Scenario-based decision support
- Leading-edge GIS framework
- Easy to use
- Reporting and data export
- Tried and tested tool

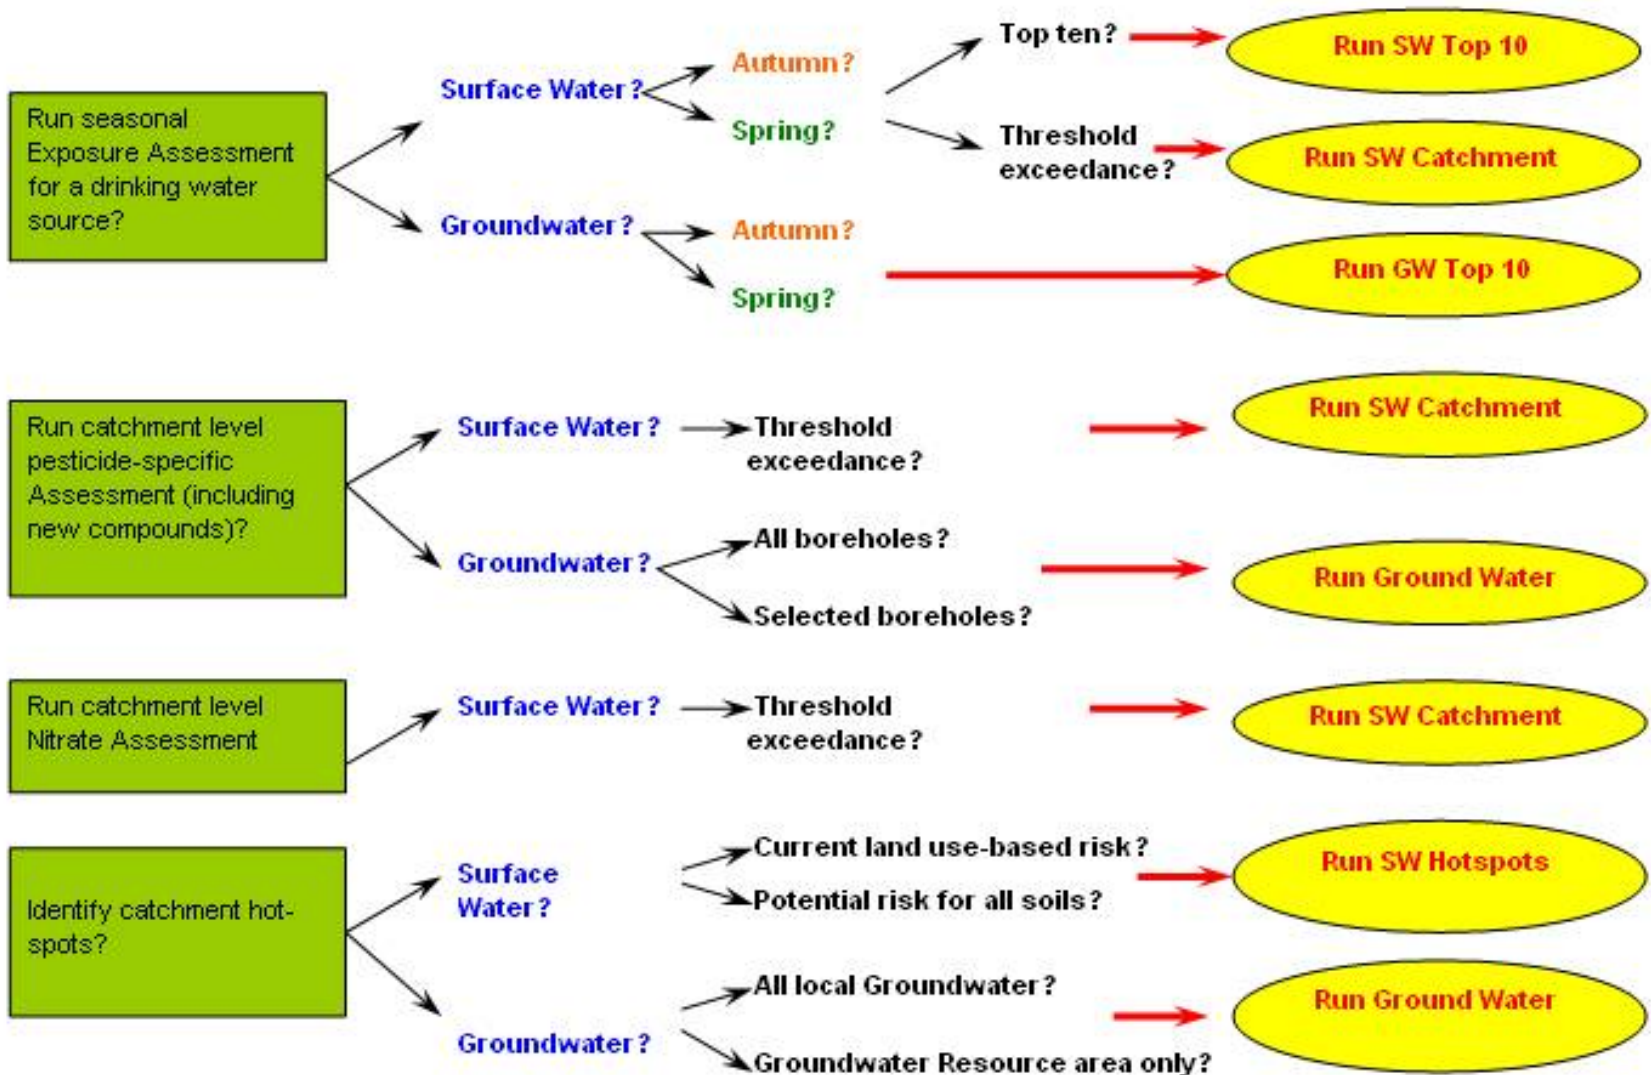

Pesticide Risk Assessment

3 ways to run pesticide risk assessment:

1. Seasonal exposure assessment
 - a) Top ten pesticides
 - b) Catchment threshold exceedance
2. Pesticide-specific assessment
 - a) Catchment threshold exceedance
 - b) Groundwater boreholes
3. Identification of catchment hot-spots
 - a) Surface water hotspots
 - b) Ground water hotspots

Modelling decision tree for CatchIS

Data Sources

- Soils (Cranfield University)
- Predictive Pesticide Usage (ADAS)
- Surface water catchments (EA)
- Soil, climate, land use (EDL)
- Groundwater boreholes and SPZ (EA)
- NVZ, NSA
- Pesticide compound property database
- Integration of client data within GIS

Climate Data

WEATHER DATA
30 year synthetic
timeseries x10 stations

Used to derived a HER
timeseries as input for
the SW and GW
models

CLIMATE DATA
Derived parameters
(XWR, FCD)
spatial coverage

Used to select
appropriate weather
station data for the grid
square to account to
spatial variability in
climate across the
catchment

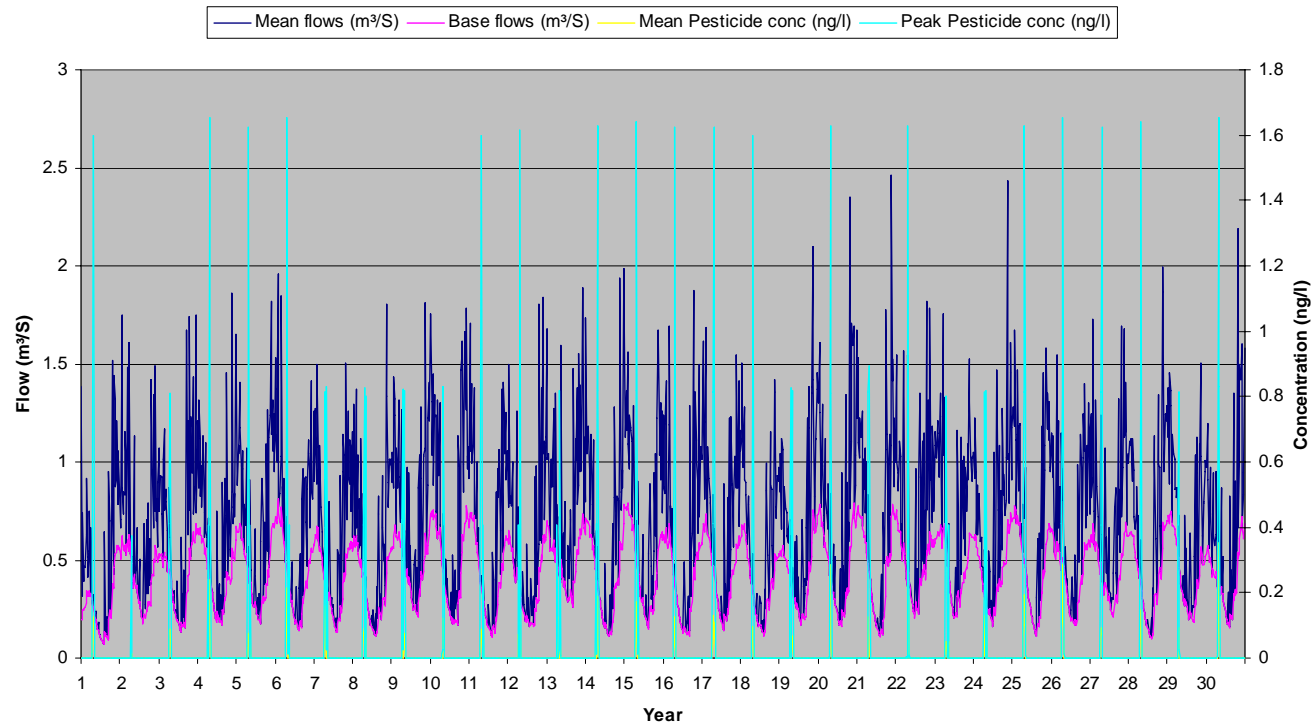

Climate Change Data

30 year Future Climate Data for UK-CIP:

- 2020 Low
- 2020 Medium High
- 2050 Medium High
- 2050 High

Yearly Spread - Chlorothalonil on Wheat for Derwent to confluence with Ecclesbourne
Weather Data = 2050 - High Distributed

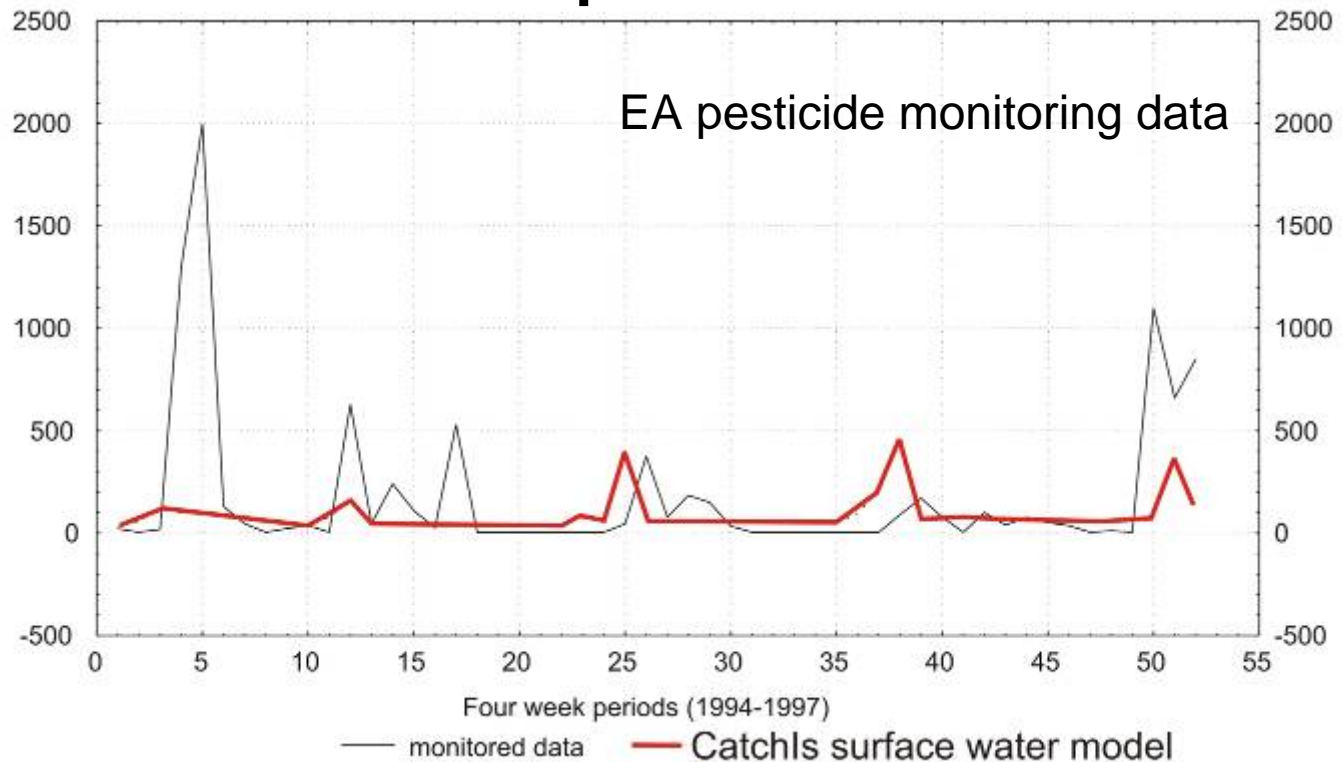

Model Development

State-of-the-art pesticide fate models comprehensively validated at national and regional levels –

Surface Water. (2,000 individual analyses; 160 catchment-pesticide combinations: 29 catchments; 16 pesticides)

Isoproturon

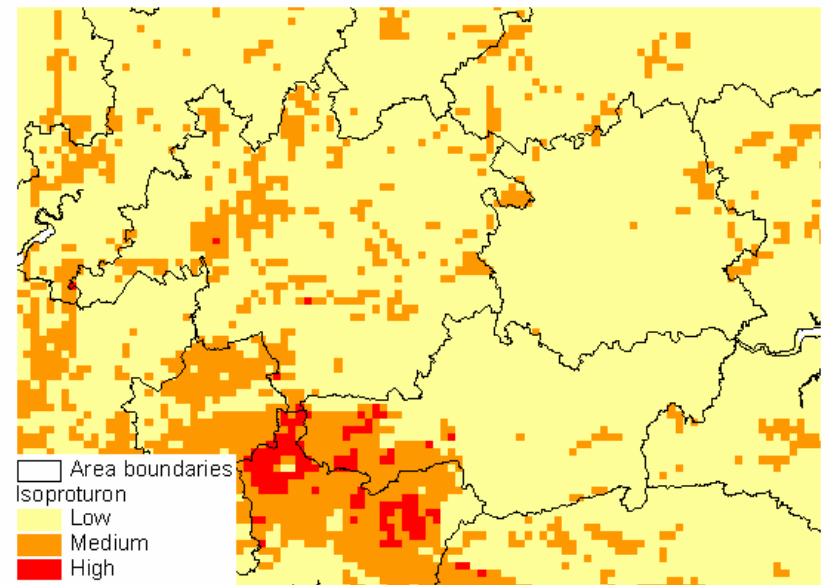

Model Development

- State-of-the-art pesticide fate models comprehensively validated at national and regional levels - **Groundwater**

Isoproturon

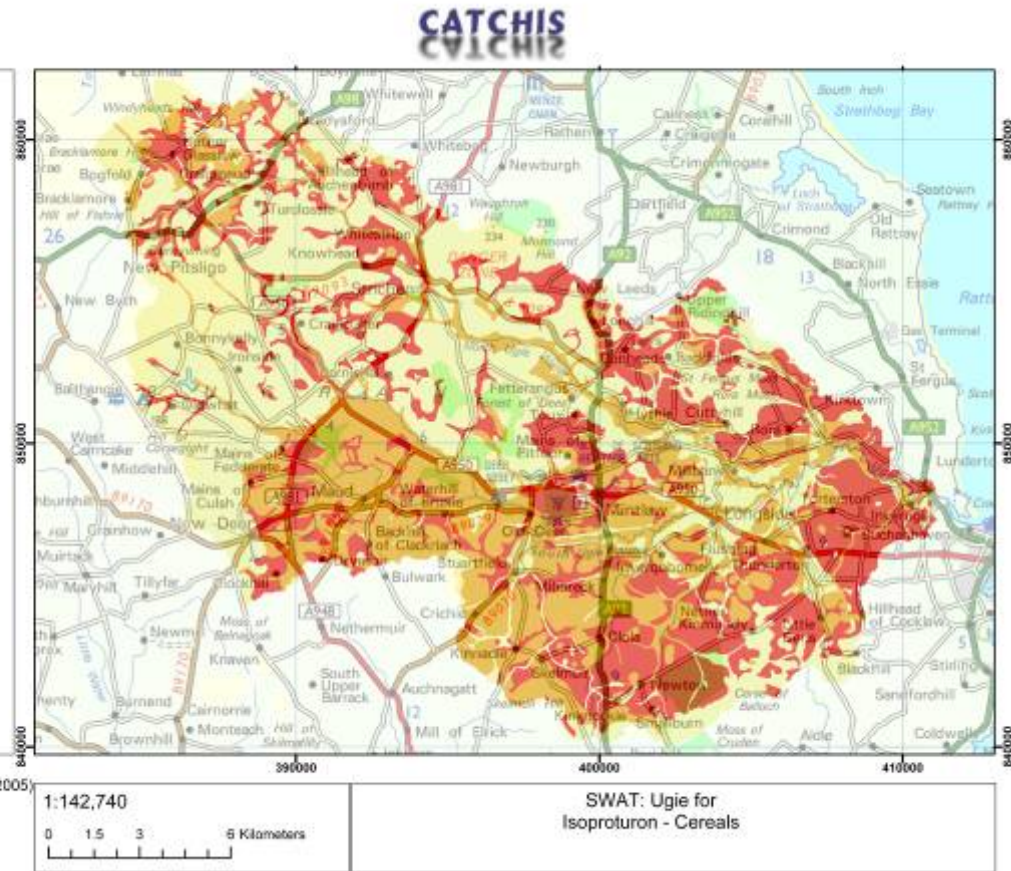

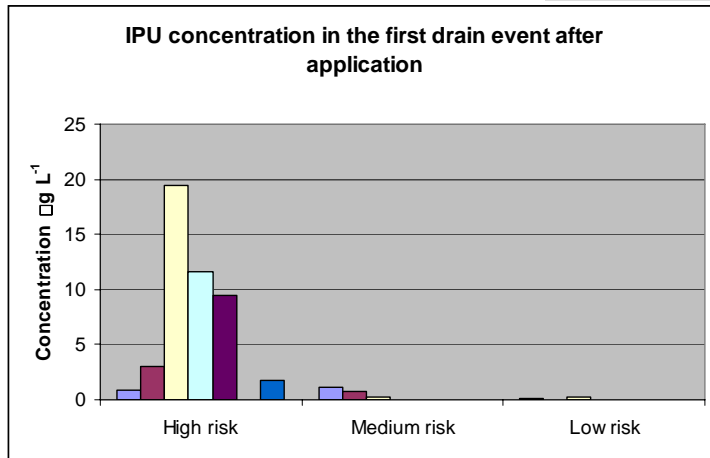

Measured (EA)

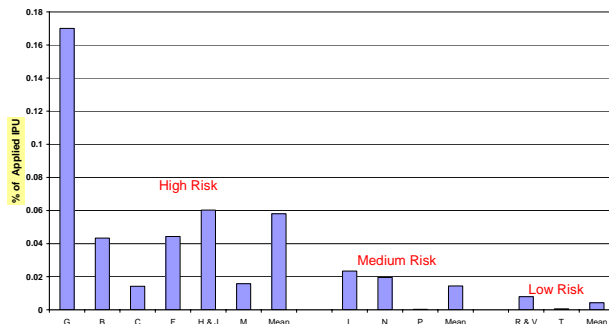

Modelled (CatchIS)

Pesticide-specific risk assessment: The Ugie catchment (**Voluntary Initiative, 2005/6**)

Model Validation

Total Estimated IPU Washout - As a Percentage of the Total Applied

Ugie leaching theory proven by computers

TESTS conducted on water entering watercourses from field drains in the River Ugie catchment area have confirmed the output of a computer model produced at Cranfield University which predicts the degree of leaching of the residual cereal herbicide Isoproturon from soil.

The tests were conducted by John Littlejohn in his capacity as project promotion officer for the **Voluntary Initiative (VI)** River Ugie Catchment Project.

Mr Littlejohn said: "It was important that we were able to validate the theory behind the model as it gives us greater confidence when promoting our recommendations for the use of Isoproturon this coming season, as these are based around the model's predictions of the leaching potential of the various soils in the catchment."

In its calculations the computer model takes into account the type and properties of the soil, local climate and several physical and chemical aspects of the herbicide before classifying the leaching potential of the soil.

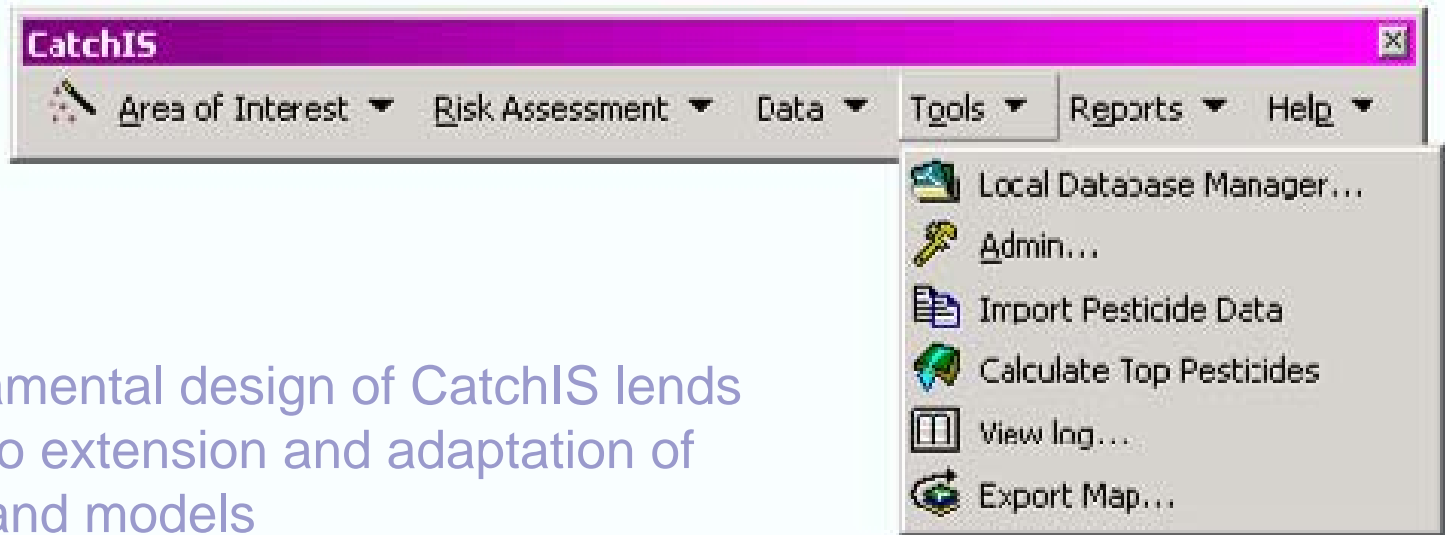

The classes are high, where leaching levels are expected to be very significant; medium, where leaching will be less severe; and low, where leaching is not anticipated to occur to any significant degree.

In the current study Isoproturon tests, on water from drains covering the three soil classifications, confirmed that Isoproturon leaching following the predicted pattern.

Scottish Water takes water from the River Ugie, which it treats at its Forehill Water Treatment Works, prior to distribution to Peterhead and the surrounding rural area. Drinking water is subject to a regulatory limit of 0.1 microgrammes per litre for pesticides.

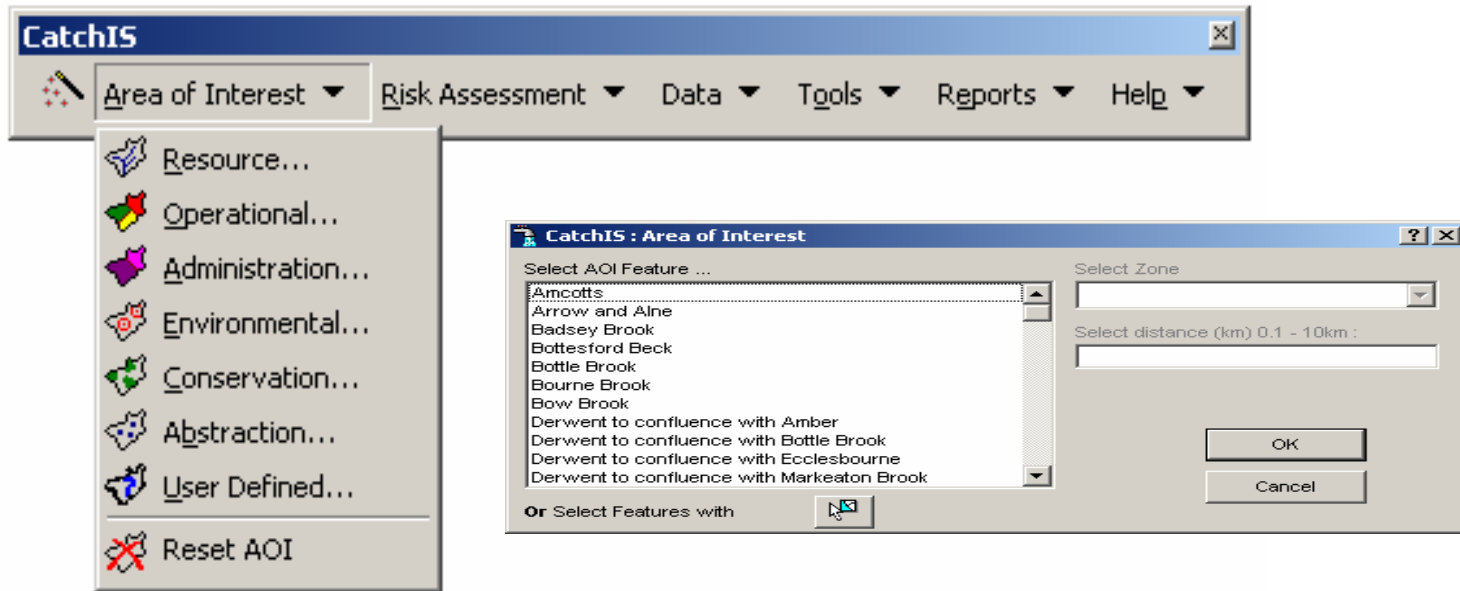

To enable Isoproturon levels to stay under the limit the River Ugie Catchment Committee has produced advice to farmers and sprayers on the use of the herbicide in the catchment.

Flexibility

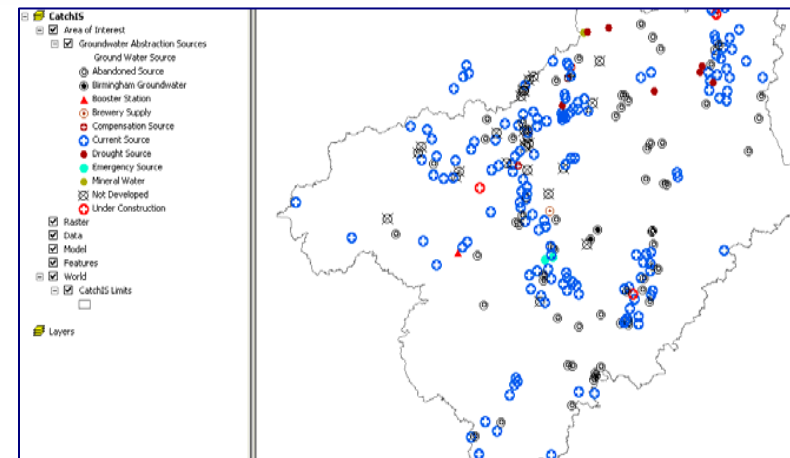

- The fundamental design of CatchIS lends flexibility to extension and adaptation of datasets and models
- Open-philosophy to model development – it is NOT a ‘black box’
- Client-led developments
- Expert scientific and technical support

Selecting Area of Interest

Areas of Interest based on user held data, but could include:

- EA Catchments
- Water framework Directive and CSF catchments
- Nitrate Sensitive Areas
- Nitrate Vulnerable Areas
- Ground Water Abstraction points
- User defined area

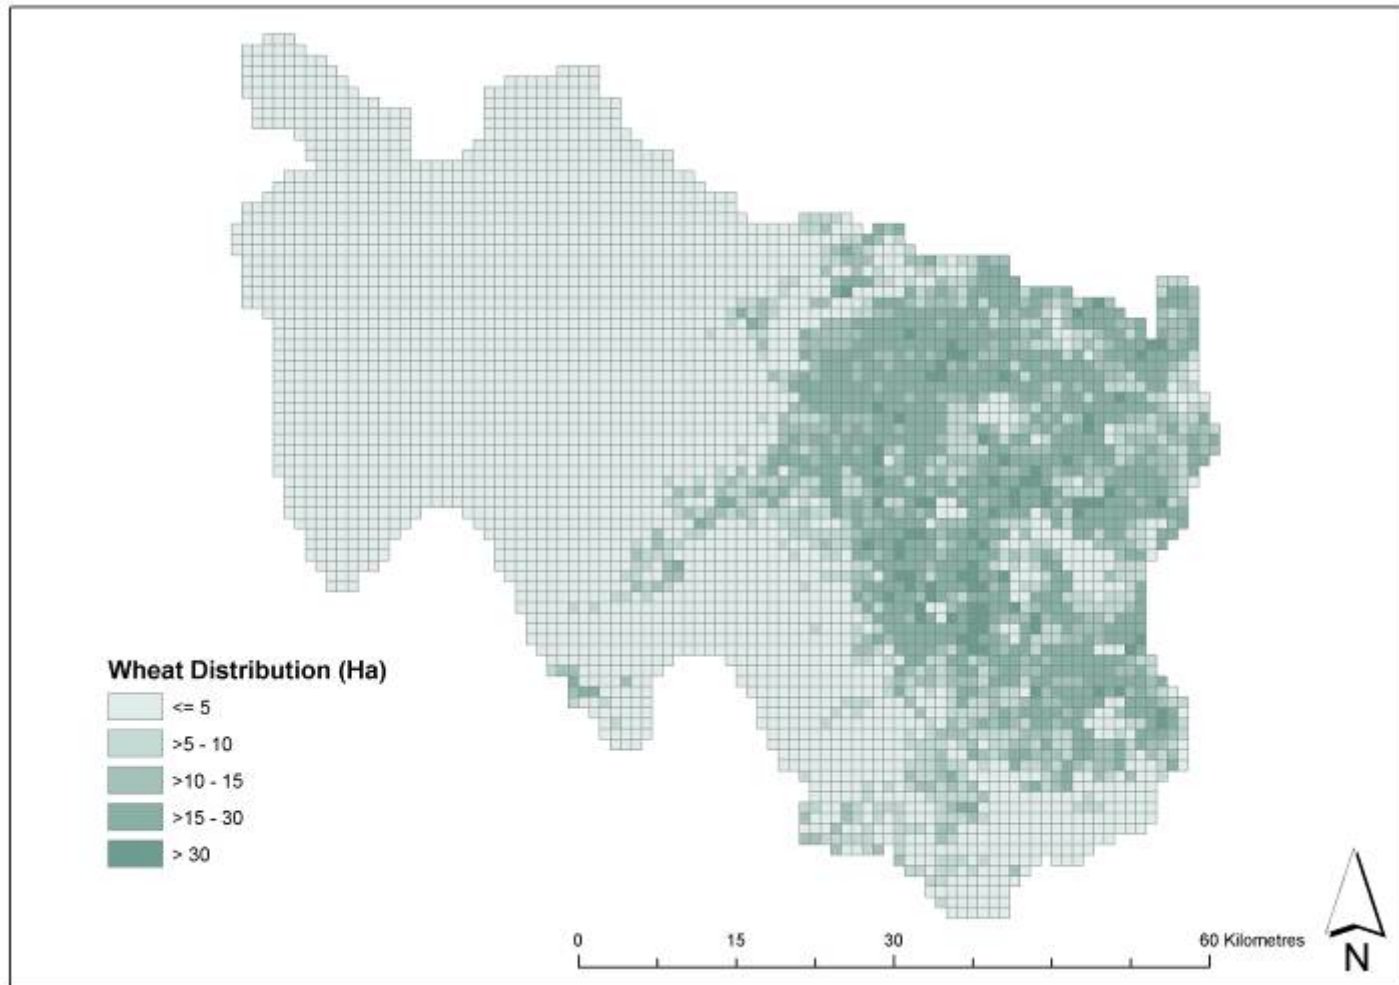

ADAS Pesticide Usage Data

- Developed using two unique data sources:
 - ADAS 1Km² agricultural census data
 - Local crop rotations and pesticide usage data from ADAS experts
- Combined using GIS

ADAS Pesticide Usage Data

- 1Km² Agricultural Census Data
 - Distribution of all crops reported in census
 - Developed from Defra's highest resolution data
 - Supplemented by other datasets (including CEH Landcover, OS Vector mapping)

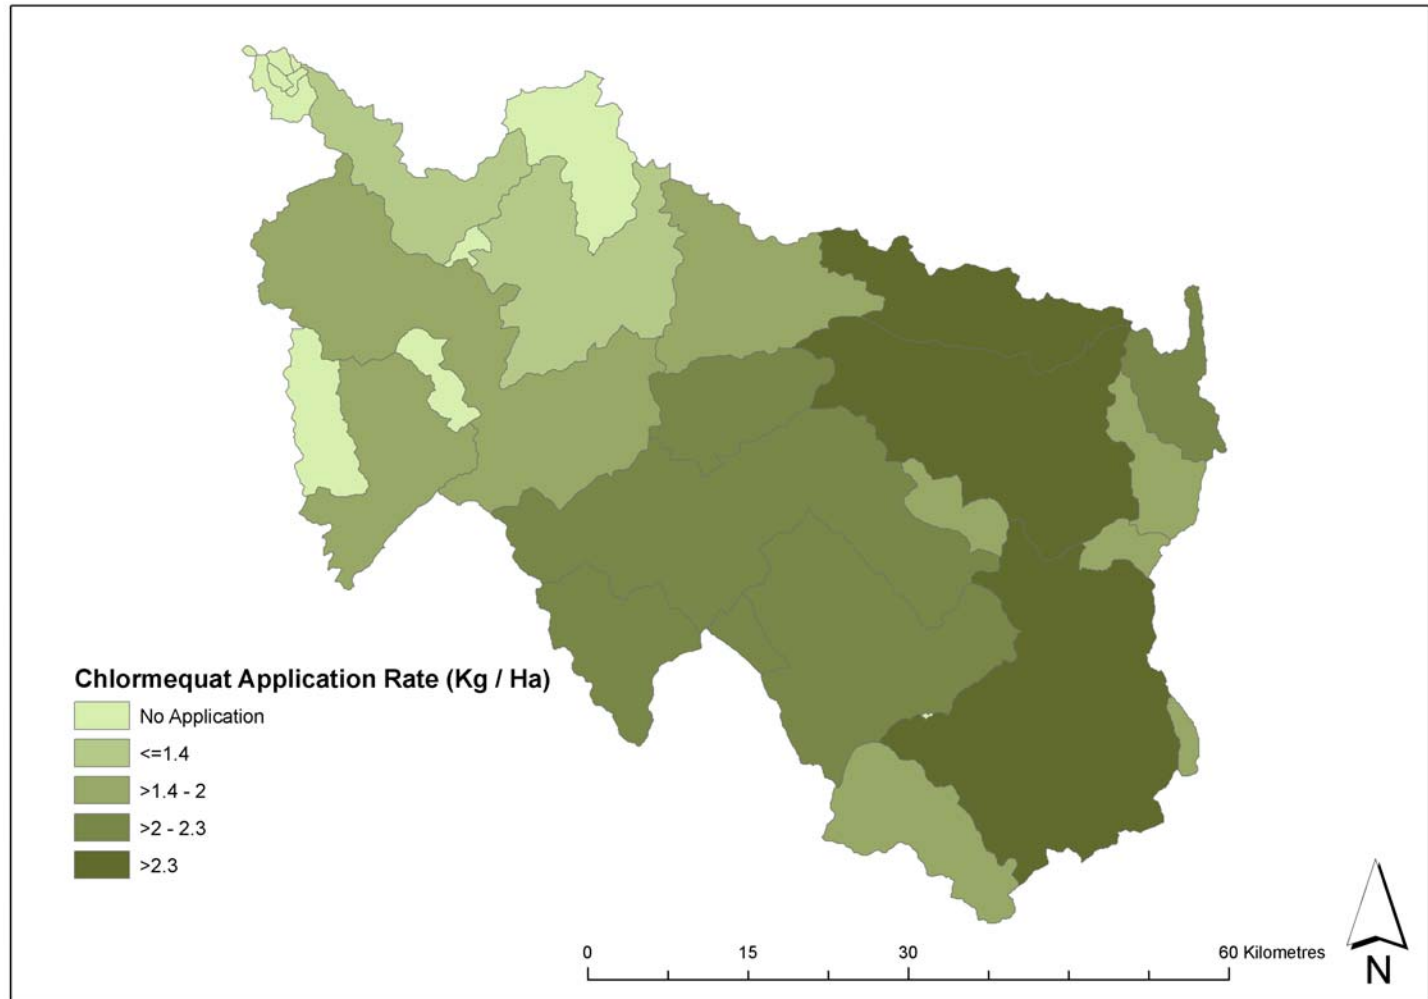

1Km² Agricultural Census Data

ADAS Expert Input

- Local Field walkers and agronomists provide:
 - Pesticide usage statistics by catchment
 - Local crop rotations by catchment (to augment the ADAS 1Km² agricultural census)
 - 6 monthly updates to account for inter-annual variation

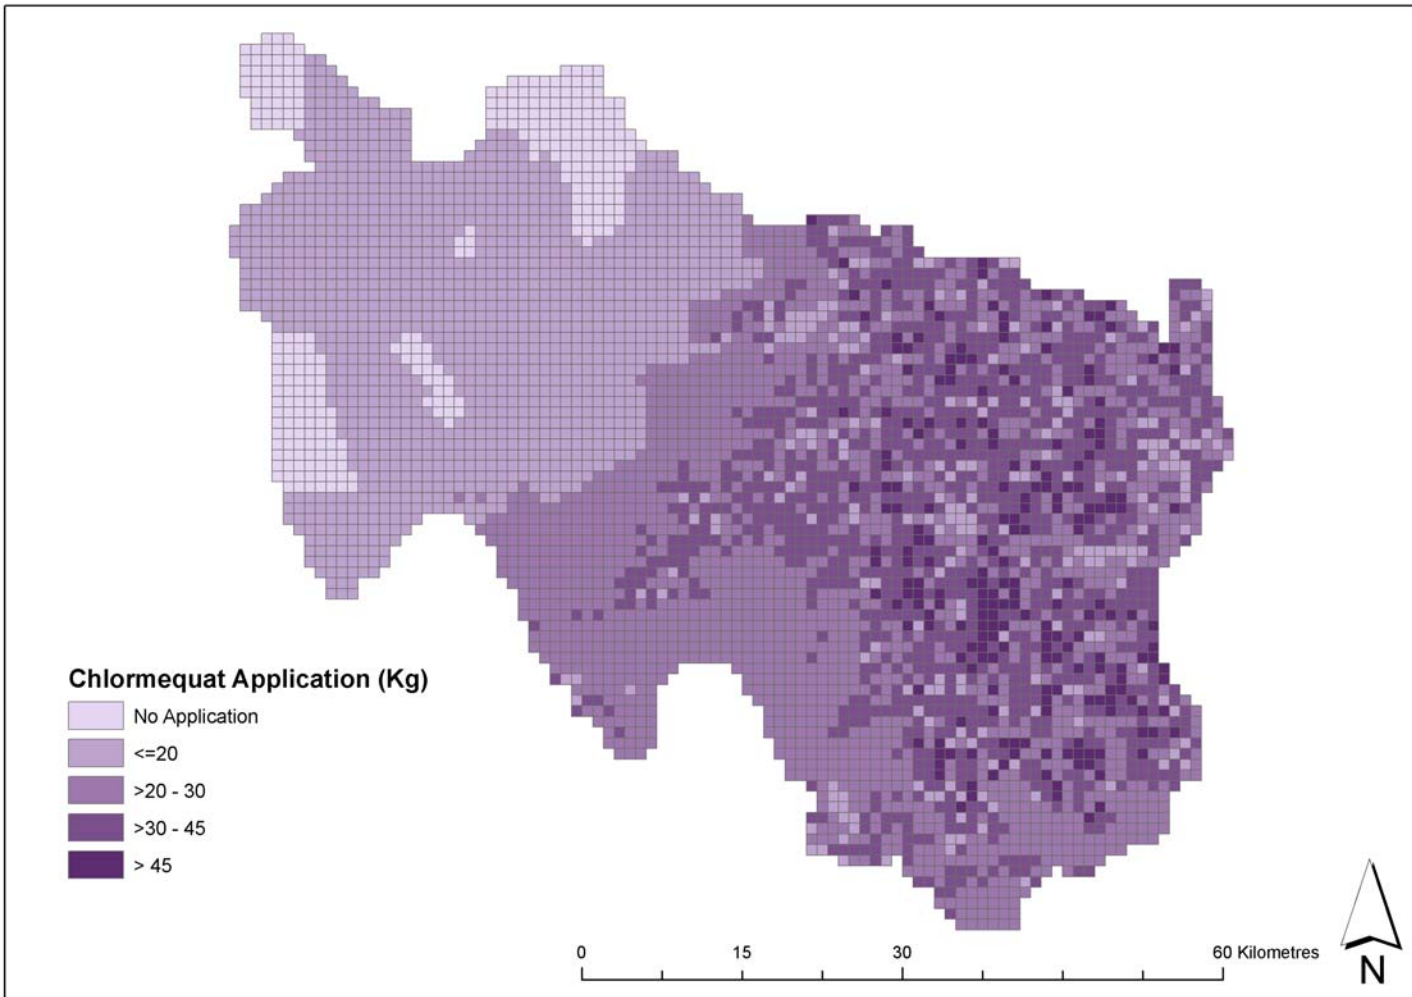

Application data

Combination of Data Sources

- Agricultural Census data modified using local rotations
- Distribution of the catchment scale pesticide usage statistics over the modified 1Km² census data
- Combination carried out in GIS providing mapped output

Crop-compound application data

Other CatchIS Options

Nitrates

Phosphates

Climate Change
